Problem:

There are many poor families in our country who don't have enough money to buy good clothes and necessary things to their children. Most of the people from such families feel bad about themselves that they are untidy. Especially during these testing times (COVID-19), the virus can be on their clothes at the very moment and may be never cleaned.

Vaccination is just a measure in controlling the spread of the virus. We need to decrease the chance of these people getting COVID-19.

New sanitized clothes are given to them by maintaining proper social distancing, which is a tough task. Our aim is to help such kind of people.

Solution:

We are going to design a mobile app to collect used clothes (with good appearance) and things (books, toys, electronic devices etc) and sell them to the poor at cheaper rates. Our application should verify their vaccination certification and their social status. All these products shall be properly sanitized and given to them by following the three S's.

These products shall only be sold to the people who got vaccinated and are in the need for such cheap clothes due to their low status.

Different:

We verify their certifications and status and make sure only the poor get these products after they have paid for it.

This app will function until the pandemic ends.

This app can be released world-wide so that any person in any corner of the world can help the poor.

The people who donate shall have their name displayed in the App.
Any other details on that person shall be password protected.

We get clothes from people out of their own good will.

We can give a certificate of appreciation. If possible it can also be signed by a prominent figure.

Impact

This is the second step in controlling the spread of corona virus.

Many shall benefit from this, not only the poor.
